

How to calculate a premium indication for Investment Risk.

Country

Select the country in which entity being invested in is located

Currency

Currency denomination of investment

Amount Investment in currency

Investment amount in currency.

The insured amount of a shareholding is its book value. This is the proportion that the investor's shareholding represents of the total number of outstanding shares of that company. The insured amount of a loan provided by the investor is the outstanding amount of the principal. During the life of the investment, the insured amount is adjusted according to developments, so the insured amount can be increased if the value of the investment increases. But the insured amount can also be reduced in case of losses or if a loan is repaid.

Exchange Rate

Fill in the exchange rate you use to convert the currency used to EUR here. Enter this only if the contract amount is not in EUR. Use the most current rate and the currency convention indicated.

Exchange rate, convention 1 ForEx = EUR (USD 1.-- = EUR ...)

Investment amount in EUR

Is automatically calculated by the system. (Investment amount in currency times the exchange rate).

Covered risks

Investment insurance provides coverage for the following political risks: expropriation, transfer restrictions and war (including other forms of political violence). In addition, breach of contract risk can be included in cover upon request. This additional insurance provides coverage for losses resulting from non-performance or non-recognition of investment-related contracts entered into with local governments. Such contracts usually concern the supply of goods and/or services that (according to the laws of the investment host country) only the (local) government can provide.

Here it is indicated (by ticking) which risks are insured.

- Transfer
- War
- Expropriation
- Breach of contract
